What's inside

00 Executive Summary & 90-Day Master Plan

The ask, the timeline, the budget, the risks

01 MVP Readiness & Product Roadmap

Where the product is, and the path to launch-ready

02 Fundraising Plan

The ask, the story, the investors, the timeline

03 Growth Plan

ICP, channels, funnel, and the numbers

04 Social-Media Growth Plan

Platforms, pillars, cadence, and a 90-day calendar

05 Product Visibility & Launch

Waitlist → beta → Product Hunt, honestly

This memo is forward-looking. Every capability described as “live” is demonstrable today; everything else is labelled as a plan. Testnet is called testnet; capped mainnet is called capped. There is no token and no implied security audit — the audit is the first thing this plan buys.

The plan on one screen

The ask, a one-glance master timeline, the budget, the KPI dashboard, the risks, and the single definition of “ready to launch.”

1. Executive summary

Intent Wallet is the AI-native, non-custodial wallet — "talk to your money." You type an intent in plain English ("swap 100 USDC for ETH"); the wallet plans the route, a *deterministic on-device safety gate* checks it against risk + policy, and your device signs — across Bitcoin, Ethereum + L2s, and Solana under one identity. The hard part is already built and demo-able: on-device keys (scrypt + AES-256-GCM, BIP-32/44/84 + SLIP-0010 conformance-tested), real device-signed execution live on Sepolia / Solana devnet / BTC testnet, and a guarded mainnet ETH opt-in. **The ask: a \$1.5M pre-seed on a post-money SAFE (\$12M cap).** The 90-day promise is a single, verifiable milestone set that clears a seed round — *audited, guarded-mainnet-live, and beta-proven with real users moving real funds* — reached by launching narrow, honest, and conservative. The pacing item is one blocking gate: an independent third-party security audit of the key-management, signing, and backup paths, engaged in Sprint 1 and published clean before public launch.

2. Master timeline — one glance

SPRINT	PRODUCT	FUNDRAISE	GROWTH	SOCIAL	LAUNCH
S1 · Days 1–30 <i>Harden + audit-prep</i>	Sign audit SOW; threat model + hardening pass; backend to staging; freeze narrow launch chain-set	Deck/demo/data room + SAFE ready; submit accelerator apps (a16z CSX, Alliance DAO); build 150–200-name target list	Stand up waitlist + build-in-public engine; hand-hold first ~100 beta activations; learn the funnel	Establish founder voice; origin-story + safety-gate threads; recruit 30 micro-KOLs	Waitlist live D1; Alpha cohort (50) on real testnet; Discord/TG home base; PH supporter list started
S2 · Days 31–60 <i>Private beta (real, capped)</i>	Audit executing, remediate weekly; wire narrow mainnet set behind caps + kill-switch; burn down UX debt	20–30 investor meetings, batched; drive a lead on the \$12M cap; accelerator decisions land	Launch quests + "Guard-a-Friend" referral loop; push activation rate + k-factor	Depth + demos; first KOL collabs/Spaces; mobile reveal; "roast my wallet" AMA	Beta-1 (~150) real-fund dogfood; PH assets locked; ≥1 ecosystem LOI; press pitches out

SPRINT	PRODUCT	FUNDRAISE	GROWTH	SOCIAL	LAUNCH
S3 · Days 61–90 <i>Public beta launch</i>	Final audit report — 100% high/critical fixed + re-tested; production backend + SLOs; kill-switch drill	Fill + sign SAFEs, collect wires, close ~\$1.5M ; audit report anchors diligence	Scale invites on the proven funnel; harden retention; package WRIE into the raise	Agents×crypto thesis; guarded-mainnet demo; 90-day recap + micro-KOL waitlist drive	T-minus → Product Hunt (top-3) public beta; compliance live; audit report front-and-center

3. Lean 90-day budget (assumes a modest pre-seed close mid-plan)

LINE ITEM	EST. COST	NOTES
Security audit (deposit + engagement)	\$55,000	Targeted wallet/key-mgmt + signing + backup review; deposit in S1, bulk paid in S2 as work executes; fix-and-re-test round reserved
Mainnet build + infra	\$18,000	RPC/provider contracts, gas float, monitoring/alerting for the frozen launch chain-set; staging → production backend
First engineering hire (partial, ~from D45)	\$28,000	Sr. protocol/security or full-stack eng, ~1.5 mo loaded inside the window; full ramp post-close
Founder salary	\$30,000	Below-market (~\$10k/mo); signals discipline
Legal + compliance	\$22,000	Delaware C-corp + SAFE docs, non-custodial risk disclosure, geofencing/sanctions plan, token-timing memo
Growth + community	\$16,000	Fractional CM (~2.5 mo), design/motion for clips, disclosed A-tier KOL honoraria, tooling
Fundraise costs	\$4,000	Demo video, data-room tooling, minor partner-meeting travel
Bug-bounty seed pool	\$5,000	Small Immunefi/Cantina pool opened at beta
Contingency (~10%)	\$18,000	Re-audit round / overruns
Total 90-day outlay	~\$196,000	~13% of a \$1.5M close; leaves ~16+ months runway for the seed push

4. Consolidated KPI dashboard

METRIC	DAY 30	DAY 60	DAY 90 TARGET
Audit (the gate)	SOW signed, dates booked	Executing + remediating weekly	Report published, 100% high/critical fixed
Fundraise	Accelerator apps in; target list built	Lead soft-circled on \$12M cap	~\$1.5M pre-seed closed
Waitlist (verified email + X handle)	1,200	4,000	10,000

METRIC	DAY 30	DAY 60	DAY 90 TARGET
Beta invited (cumulative)	100	500	1,500
Activated (≥ 1 real intent executed)	40	250	800
WRIE — north star (real intents/wk)	60	350	1,300
Referral k-factor	0.15	0.25	0.35
X followers (engaged)	750	2,500	6,000
Loss-of-funds incidents	0	0	0 (non-negotiable)

5. Top 6 risks + mitigations

#	RISK	MITIGATION
1	Audit slips or finds criticals — the whole plan paces off it	Engage in S1, book 6–10 wks ahead; remediate in parallel (don't wait for the final report); fix-and-re-test round pre-budgeted; launch narrative never assumes an optimistic pass date
2	Loss-of-funds in beta — for a wallet, the first drained user is an extinction event	Invite-only, <i>consented</i> cohort; conservative spend caps ($\leq \$1,000$, raised deliberately); tested remote kill-switch + incident runbook; bug-bounty pool
3	Fundraise stalls — no lead by Day 60	Milestone gate: pause, tighten demo + traction slide, re-open with a sharper wedge; accelerators applied early to de-risk "solo, pre-audit"; low burn + below-market founder comp extends runway
4	Solo-founder bandwidth / key-person risk	Hire eng early; fractional CM from D15; ruthless scope (narrow launch chain-set); realistic social cadence over heroics
5	Compliance / regulatory exposure (custody framing, sanctions)	Non-custodial posture + counsel sign-off; geofencing + OFAC screening live before public launch; honest marketing — testnet called testnet, capped mainnet called capped
6	Traction shortfall — signups don't convert to real intents	Optimize time-to-first-intent, not top-of-funnel volume; activation-gated referral loop (reward only on first executed intent); WRIE as the un-fakeable north star

6. Definition of Ready to Launch

Public beta is authorized only when **every** box is checked:

- ☐ **Audited** — independent firm reviewed key-management + signing + encrypted backup; all high/critical findings fixed and re-tested; **report published** (the diligence + trust anchor).
- ☐ **Non-custodial verified end-to-end** — keys provably never leave the device; encrypted backup + restore tested across web and mobile.
- ☐ **Mainnet, honest and bounded** — the frozen narrow launch chain-set executes real transactions behind explicit real-funds confirm + spend caps + a **drill-tested kill-switch**; no chain is claimed that

isn't wired.

- ☐ **Beta-proven** — real users moved real funds with **zero loss-of-funds incidents**; top UX blockers closed; crash/error rate under the agreed threshold.
- ☐ **Production backend** — deployed, monitored, on-call, meeting SLOs; load-tested for launch-day traffic.
- ☐ **Compliant** — ToS, risk disclosures, geofencing, and sanctions screening live with counsel sign-off.
- ☐ **Honest marketing** — every claim on the site and in the deck is demonstrable; testnet is labeled testnet, capped mainnet is labeled capped, no implied audit or token.

The bar is deliberately conservative: launch narrow, audited, and honest — then widen caps and chains on evidence.

MVP Readiness & Product Roadmap

1. MVP Readiness Scorecard (honest)

Status is graded against one bar: *can a stranger self-custody real money with this today?* Testnet-proven ≠ Done.

CAPABILITY	STATUS	NOTE
Core wallet (create / import / unlock / encrypted backup)	Done	Client-side, non-custodial. scrypt + AES-256-GCM, keys generated + encrypted on-device, never sent to server. BIP-32/44/84 + SLIP-0010 conformance-tested.
On-chain execution — testnet	Done	Real device-signed broadcast: ETH + ERC-20 + a settlement-safe Uniswap v3 swap on Sepolia; Solana devnet; Bitcoin testnet. Browser + mobile.
On-chain execution — mainnet	Partial	Only guarded ETH-native opt-in (explicit real-funds confirm + \$1,000 spend cap). Mainnet ERC-20, swaps, Solana, and BTC are not wired.
AI intent flow (parse → risk → policy → route → settle)	Done	Deterministic parser + optional real LLM parse; risk engine, policy engine, router, settlement all live. Doctrine holds: AI proposes, deterministic code verifies, device signature disposes.
Security — engineering	Partial	Sound architecture (on-device keys, spend caps, Manual/Auto modes). But no third-party audit — see §2.
Mainnet coverage (multi-chain)	Missing	Full mainnet across BTC / EVM ERC-20 + swaps / Solana is the largest functional gap to a real launch.
Mobile	Done (testnet)	Expo/React Native, 5-tab IA, real execution on testnets; inherits the same mainnet gap as web.
Backend API	Partial	Fastify + SIWE auth, rate limiting, metrics — runs in dev only . No production deploy, SLOs, or on-call.
Third-party security audit	Missing	The single blocking gate. No audit engaged. Mandatory before any real-fund GA.
Compliance (ToS, disclosures, geofencing, sanctions)	Missing	Non-custodial lowers the bar but does not remove it: needs counsel review, risk disclosures, and OFAC/sanctions screening before public launch.
Traction (users, app-store listings, token)	Missing	Pre-launch by design. No users, no store listings, no token.

One-line read: the *hard* part — a non-custodial, multi-chain, AI-intent wallet that really signs and broadcasts — is **built and demo-able**. What remains is the *unforgiving* part: audit, mainnet hardening, and a production backend. That ordering is the plan below.

2. The single biggest gate: a third-party security audit

Say it plainly: no real-fund, public launch happens until an independent security firm audits the key-management, signing, and encrypted-backup paths and we remediate every high/critical finding. This is a wallet that *holds the keys to people's money*. Self-signed assurances are worth nothing to a user who gets drained, and any serious investor's technical diligence will ask for the audit report by name.

- **Scope that matters** (not smart contracts — this is a *wallet*): seed generation + entropy, BIP-32/44/84 & SLIP-0010 derivation, scrypt/AES-256-GCM backup, the on-device signing flow, spend-cap + Auto-mode enforcement, and the browser/extension attack surface (supply chain, XSS, key exfiltration).
 - **Who does this class of work:** [Trail of Bits](#) (adversarial, exploit-driven review of signing + key-management logic), [Cure53](#) (hands-on assessments mapped to concrete remediation), and [Halborn](#) are the reference names for wallet-grade audits.
 - **Realistic timeline:** a focused wallet audit runs roughly **2–6 weeks** of firm time depending on scope ([Halborn cites 2–4 weeks for standard scope](#)); book **6–10 weeks ahead** — reputable firms have queues. Budget for a **fix-and-re-test round** after the first report, not a one-shot pass.
 - **Sequencing consequence:** audit is the pacing item for the whole 90 days. Engage in Sprint 1, audit during Sprint 2, launch on a clean report in Sprint 3. Everything else schedules around it.
-

3. 90-Day Roadmap (Day 0 = kickoff)

Three 30-day sprints. Each has a hard exit gate; you do not advance until the gate is green.

SPRINT 1 — DAYS 1–30: HARDEN + AUDIT-PREP

Goal: make the codebase auditable and lock the audit slot.

Deliverables - Audit engaged: firm selected, SOW + scope signed, audit dates on the calendar (booked to start in Sprint 2). **Owner: Founder.** - **Threat model + security spec** written for the auditor: key lifecycle, backup, signing, spend-cap enforcement, trust boundaries. - **Internal hardening pass:** dependency + supply-chain audit ([npm audit](#) , pinned lockfiles, SRI where relevant), secrets hygiene, CSP/XSS review on web, and a self-run test of the drain-attack surface. - **Mainnet plan frozen:** decide the *launch chain set* — recommend narrow and deep (ETH-mainnet native + top-3 ERC-20 + one audited swap route) over broad and shallow. Everything else stays testnet at launch. - **Backend to staging:** deploy Fastify API to a real environment behind TLS, with basic metrics/alerting and a documented runbook. - **Compliance kickoff:** engage counsel for ToS, non-custodial risk disclosure, and a geofencing/sanctions-screening plan.

Exit criteria - [] Signed audit SOW with dates. - [] Zero known high/critical issues in the internal hardening pass (or each has an owner + fix date). - [] Backend live in staging with alerting. - [] Launch chain-set decision documented and mainnet execution work scoped into Sprint 2.

SPRINT 2 — DAYS 31–60: PRIVATE BETA (REAL FUNDS, CAPPED, INVITE-ONLY)

Goal: run the audit while a tiny, consented cohort uses real money under tight caps.

Deliverables - Audit executing: firm actively reviewing; triage findings weekly; begin remediation immediately (don't wait for the final report). - **Mainnet launch set wired:** the frozen chain set moves from testnet to real mainnet execution, behind the **existing** guardrails — explicit real-funds confirm + a **conservative spend cap** (start at/under the current \$1,000, raise deliberately). - **Private beta:** 25–75 invited users who *knowingly* accept "beta, pre-audit-completion, cap your funds." Instrument everything: intent-parse accuracy, tx success/failure, time-to-first-successful-intent, and every support ticket. - **Kill-switch + incident runbook:** a tested ability to disable mainnet execution remotely, plus a written incident-response process. - **Beta feedback loop:** burn down the ~27 open UX/edge-case items, prioritized by what beta users actually hit.

Exit criteria - [] Final audit report received; **100% of high/critical findings remediated and re-tested;** mediums triaged with a plan. - [] ≥ N successful real-fund mainnet intents across the beta cohort with **zero loss-of-funds incidents.** - [] Kill-switch verified in a live drill. - [] Top UX blockers closed; crash/error rate under an agreed threshold.

SPRINT 3 — DAYS 61–90: PUBLIC LAUNCH

Goal: open the doors on a clean audit report.

Deliverables - Published audit report (or a public summary + remediation attestation) — this is the trust anchor and the diligence artifact. - **App-store submissions:** iOS/Android through review; web app on production infra. - **Production backend:** SLOs, rate limits, monitoring/on-call, and load-tested for launch-day traffic. - **Compliance live:** ToS + disclosures shipped, geofencing + sanctions screening enforced, counsel sign-off on file. - **Graduated cap policy:** a documented path to raise spend caps and add chains *after* launch, gated on stability data. - **Launch narrative + assets:** "The AI-native wallet — talk to your money," with an honest demo (real testnet + capped mainnet), landing page, and the audit report front-and-center.

Exit criteria — public GA when all true - [] Clean/remediated audit report published. - [] Apps live in stores (or web GA) and installable by the public. - [] Production backend meeting its SLOs with on-call coverage. - [] Compliance controls enforced in production.

Definition of Launch-Ready

Public launch is authorized only when **every** box is checked:

- ☐ **Audited:** independent firm has reviewed key-management + signing + backup; all high/critical findings fixed and re-tested; report published.
- ☐ **Non-custodial verified end-to-end:** keys provably never leave the device; encrypted backup restore tested across web + mobile.
- ☐ **Mainnet, honest and bounded:** the launch chain set executes real transactions behind explicit confirm + spend caps + a working kill-switch. No chain is claimed that isn't wired.
- ☐ **Beta-proven:** real users moved real funds with zero loss-of-funds incidents; top UX blockers closed.
- ☐ **Production backend:** deployed, monitored, on-call, meeting SLOs.
- ☐ **Compliant:** ToS, risk disclosures, geofencing, and sanctions screening live with counsel sign-off.

- ☐ **Honest marketing:** every claim on the site and in the deck is demonstrable — testnet is called testnet, capped mainnet is called capped.

The bar is deliberately conservative: for a wallet, the first drained user is an extinction event. Launch narrow, audited, and honest — then widen caps and chains on evidence.

Funding context: this 90-day plan — *audited, mainnet-live, beta-proven* — is precisely the milestone set that clears a crypto seed round, where 2025–2026 medians run ~\$5M median check into ~\$34M valuations, with an AI premium on top ([Flowjam/Carta](#), [SVB 2026 crypto outlook](#)). The audit report is the single artifact that turns "impressive demo" into "fundable, launchable wallet."

Fundraising Plan

NB: This is startup fundraising *strategy*, not personal investment advice. All figures are forward-looking targets grounded in 2025–2026 market data (sources cited below); actual terms are set by the market and your lead.

Recommended round: Pre-seed

You are pre-traction, pre-audit, pre-launch, and solo/lean — that is textbook **pre-seed**, not seed. Do not try to price an equity round or chase a seed narrative you can't yet defend with users. Raise one clean pre-seed to hit **three checkable milestones**: (1) a completed third-party security audit, (2) guarded mainnet coverage live across ETH + one L2, Solana, and BTC, and (3) a waitlist of design-partner users. Those three unlock the seed at a real step-up.

Target range: \$1.25M–\$1.75M, anchor \$1.5M. Rationale: 2025–2026 US pre-seed rounds cluster at **\$250K–\$1.5M (median ~\$1M)**, with AI/deep-tech teams pushing to ~\$2M. You sit in the top band — you're crypto **and** AI-native, the two narratives commanding a premium — but you're a solo builder with no audit and no users, which caps the top. \$1.5M buys ~18–20 months of runway, an audit, and 2 hires without over-diluting before the value-creating milestones land.

Use of funds (\$1.5M raise → ~18–20 months runway)

BUCKET	ALLOCATION	%	WHAT IT BUYS
Security audit + bug bounty	\$140K	9%	Reputable-firm review of key-management/crypto + swap-settlement paths (~\$60–80K), 1–2 re-audit passes (\$5–20K each), and an Immunefi/Cantina bug-bounty pool. Non-negotiable for custody-of-keys.
Mainnet build + infra	\$230K	15%	Mainnet ERC-20 + swaps + Solana + BTC coverage, RPC/provider contracts, gas float, monitoring/alerting, reliability hardening
Team — 2 hires	\$700K	47%	Sr. protocol/security engineer + full-stack/mobile engineer, ~18 mo fully loaded
Founder salary	\$180K	12%	Below-market founder comp, ~18 mo (signals discipline to investors)
Growth + community	\$130K	9%	Waitlist, 10–20 design partners, content/narrative, launch, KOL seeding
Legal + ops + buffer	\$120K	8%	Delaware C-corp, SAFE docs, token/regulatory counsel, compliance memo, contingency
Total	\$1.5M	100%	

Audit benchmark reality: top firms (Trail of Bits, OpenZeppelin) run ~\$25K/engineer/week; a focused wallet/key-management + swap-interaction review lands ~\$40–80K plus re-audit, well within the bucket. You are **not** a 50-contract DeFi protocol, so budget for a *targeted* review, not a \$200K enterprise engagement.

Instrument and valuation cap

- **Post-money SAFE, valuation cap, no discount, MFN.** In Q3 2025 SAFEs were ~92% of all pre-priced rounds (Carta) — this is the standard; don't invent structure. No priced round at pre-seed.
- **Cap: \$12M, flexible to \$15M for a strong lead.** Market median caps are ~\$10M for sub-\$1M rounds and ~\$15M for \$1M–\$2.5M rounds; the AI + crypto premium justifies anchoring at the top of your band's range. Give your **earliest angels an MFN + a lower cap (\$8–10M)** to reward conviction before you have a lead.
- Keep the option pool out of the SAFE math; create/expand it at the priced seed. Aim to sell ~10–13% on the SAFE (\$1.5M / \$12–15M cap).

Investor story (4–5 lines)

Wallets are still command lines. We made money speak English. Intent Wallet is the AI-native, non-custodial wallet where you type "swap 100 USDC for ETH" and the wallet plans the route, a *deterministic on-device safety gate* checks it against risk + policy, and your device signs — across Bitcoin, Ethereum + L2s, and Solana under one identity. **AI proposes, deterministic code verifies, the device signature disposes** — so we get agentic UX *without* the "AI drained my wallet" failure mode. It's real today: non-custodial keys, live testnet execution on three chains, guarded mainnet. We're raising a pre-seed to audit, ship full mainnet, and turn a waitlist into our first self-custody users — riding the AI-agents-x-crypto and chain-abstraction waves of 2026.

Pitch-deck outline (13 slides)

1. **Title / one-liner** — "Your wallet, in plain English." Logo, tagline, contact, raise ask.
2. **Problem** — self-custody is a command line: seed phrases, chain-switching, hex, rug/approval risk. Normal people bounce; agents make it *more* dangerous.
3. **Insight / why now** — 2025–2026 convergence of AI agents, intents/chain-abstraction, and self-custody UX. The missing piece is a *safety gate* between AI and signing.
4. **Solution** — intent → plan → deterministic risk+policy check → device signs. The doctrine line. One universal identity, three addresses.
5. **Live demo** — GIF/video of a natural-language swap + send executing on testnet; guarded-mainnet confirm.
6. **Product / architecture** — on-device scrypt + AES-256-GCM, BIP-32/44/84 + SLIP-0010 conformance-tested; ~30-package TS monorepo (intents, risk, router, settlement, solver). Non-custodial by design.
7. **Why we're different (moat)** — vs MetaMask/Phantom/Rabby: natural-language intents + **deterministic on-device safety gate + one multi-chain identity**, fully non-custodial. Not a wrapper; a verification layer.

8. **Market & wedge** — self-custody wallet users + the coming wave of agentic on-chain activity; land with power users, expand to mainstream.
9. **Traction (honest)** — what's *real and working* today (label testnet vs mainnet explicitly), conformance tests passed, waitlist number. No vanity metrics.
10. **Business model** — swap/routing fees, premium automation tiers, eventual token — framed as forward-looking, not live revenue.
11. **Roadmap / milestones** — 90-day: audit + mainnet + waitlist; 6-mo: mainnet coverage complete, first 1k self-custody users; 12-mo: seed metrics.
12. **Team** — you (what you built solo is the proof), planned first 2 hires, advisors.
13. **The ask** — raising **\$1.5M pre-seed on a post-money SAFE, \$12M cap**; use of funds; the three milestones this buys; contact.

(Optional appendix slides: security model deep-dive, competitive matrix, financial model.)

Target investors

Sequence: **accelerators + operator-angels first** (they de-risk the "solo, pre-audit" concern and generate warm intros), then **crypto pre-seed funds** to fill the round.

Accelerators / programs — apply in Sprint 1 (highest leverage for a solo technical founder):

PROGRAM	CHECK / TERMS	FIT & HOW TO REACH
a16z Crypto Startup Accelerator (CSX)	~\$500K; ~3% acceptance	Built for web3's tech + token + regulatory reality. Apply online during open cohort; a warm intro from an a16z portfolio founder materially helps.
Alliance DAO	~\$500K; ~5% acceptance; median grad raises ~\$3.5M at ~\$25M post	"By founders, for founders," ruthlessly selective, consumer-crypto friendly. Online application + founder referral. Strongest signal for a consumer wallet.
Orange DAO Fellowship	12-week program; funding + syndicate access	YC-alumni-run web3 network. Apply ; leverage any YC connection. Their syndicate can also fill allocation.
Outlier Ventures Base Camp	~\$100–200K	Token-design + go-to-market heavy. Apply ; good if you want structured token/GTM support later.

Crypto pre-seed / early funds — target as leads or co-leads (Sprint 2):

FUND	WHY THEY FIT	REACH
Robot Ventures (Robert Leshner, Tarun Chitra)	\$75M fund that backs <i>highly technical crypto primitives at pre-seed</i> before they're obvious — your engineering-first, verification-layer story is exactly their lane	Warm intro via a technical founder in their portfolio; they move fast on small checks
Variant Fund	Deep consumer-crypto / ownership-economy thesis — a natural-language self-custody wallet is on-thesis	Warm intro; strong content/thesis alignment in outreach

FUND	WHY THEY FIT	REACH
Archetype (Ash Egan)	Technical + operational support across engineering, mechanism/protocol design; early infra/protocol conviction	Warm intro; lead with the deterministic safety-gate architecture
1confirmation (Nick Tomaino)	Contrarian, consumer-crypto, self-custody-native conviction bets	Warm intro; concise thesis-driven note
Electric Capital	Developer- and infra-centric; credibility from their crypto dev data	Warm intro; emphasize the monorepo + conformance testing
Ecosystem funds (Solana Foundation/Ventures, Base Ecosystem Fund, Coinbase Ventures)	Multi-chain coverage makes you fundable from <i>each</i> chain's ecosystem fund; often small, fast, non-lead checks	Ecosystem-fund application forms + BD contacts per chain

Angel syndicates / operator-angels (fill the round, add credibility): - **Orange DAO syndicate** and **crypto angel syndicates on AngelList**. - **Operator-angels:** founders/engineers of wallets, L2s, and self-custody infra; security researchers; ex-a16z/Coinbase operators. A handful of respected wallet/security names on the cap table is worth more than one more fund logo. - **Sourcing:** warm intros > cold. Mine your GitHub, testnet, and crypto-dev network first.

Data-room checklist

- **Deck** (above) + 2-min demo video.
- **One-pager / executive summary** and this fundraising memo.
- **Product:** live testnet demo access, architecture doc, security model write-up (sscript/AES-GCM, BIP/SLIP conformance results).
- **Code/IP:** repo access on request (or a reviewed subset), test-coverage summary, no-third-party-key-exposure attestation.
- **Roadmap:** 90-day + 12-month milestones with owners and dates.
- **Financials:** 18-month burn model, use-of-funds, cap table (pre/post SAFE).
- **Legal:** incorporation docs, **SAFE template (\$12M cap)**, IP-assignment confirmation, prior SAFEs/notes (if any).
- **Regulatory/compliance memo:** non-custodial posture, no-custody-of-user-keys, jurisdiction stance, token-timing note (from token counsel).
- **Team:** founder bio + what was built solo, hiring plan, advisors.
- **Traction:** waitlist numbers, design-partner LOIs/intros, any usage — clearly labeled testnet vs mainnet (honesty is a *feature* here).

90-day fundraising timeline (Day 0 → Day 90)

Sprint 1 — Days 1–30: Prep, list-build, apply - **D1–5:** Finalize deck, demo video, one-pager, memo; open the data room; incorporate + get SAFE from counsel. - **D3–10:** Build a **150–200-name target list** (funds/accelerators/angels above) tiered A/B/C; map the **warm-intro path to each** (who in your network connects). - **D5–15: Submit accelerator applications** (a16z CSX, Alliance DAO, Orange DAO, Outlier) —

these have lead times, so fire early. - **D10–25**: Request **15–25 warm intros**; send tight, thesis-matched notes. Line up 2–3 friendly "practice" meetings with operator-angels. - **D25–30**: Refine deck from early feedback; lock demo reliability.

Sprint 2 — Days 31–60: Meetings, momentum, term sheet - D31–50: Run **first meetings at volume** (aim 20–30 conversations). Batch them so demand is concurrent, not sequential — this is how you create a lead's FOMO. - **D40–55**: Push interested funds to **partner meetings**; drive toward a **lead / anchor** on the \$12M cap. Give earliest angels the MFN/lower-cap incentive to soft-circle now. - **D50–60**: Secure **lead SAFE commitment**; set the cap and target allocation. Accelerator decisions likely land here — a CSX/Alliance yes de-risks the rest.

Sprint 3 — Days 61–90: Fill, sign, close - D61–75: Use the lead + accelerator to **fill the round** — angels and ecosystem/non-lead funds move fast once a name anchors. Run a light "closing soon" nudge to fence-sitters. - **D75–85**: **Countersign SAFEs, collect wires**; keep the data room and cap table current. - **D85–90**: **Close and announce** (optional, measured); send a wrap-up to all who passed (they're your seed pipeline). Immediately deploy against the three milestones — **audit kickoff in week one post-close**.

Milestone gate: if by Day 60 you have neither an accelerator yes nor a soft-circled lead, pause, tighten the demo + traction slide, and re-open with a sharper wedge rather than grinding a stale list.

Growth Plan

Ideal Customer Profile (ICP)

Lead with the **crypto-native but scar-tissued** user, not the mainstream normie (that's the Year-2 market).

- **Who:** Multi-chain holders (\$1k–\$50k on-chain) who already run MetaMask / Phantom / Rabby, live on Crypto Twitter (CT) and a handful of Discords, and have been phished, rugged, or fat-fingered once — or watched a friend get drained. They're comfortable with testnets and points quests.
- **Sub-segments to seed first:** (1) AI-agent / "intents & chain-abstraction" narrative followers; (2) solo devs and technical builders who'll stress-test the parser and file issues; (3) self-custody maximalists who distrust custodial UX but hate current wallet friction.
- **Why them:** They feel the pain acutely, they evaluate on substance (they'll verify our "honest tech state" claims), and they are the distribution — one credible CT thread from this group reaches thousands of the next cohort.

Positioning & the wedge use-case

One-line position: *"The AI-native wallet with a safety gate — talk to your money, and deterministic code checks every intent before your device signs."*

Don't lead with "multi-chain" (commoditized) or "AI" alone (noise). Lead with the thing no incumbent has:

AI proposes, deterministic code verifies, the device signs.

Wedge use-case to demo everywhere: *Plain-English swap with a visible safety gate.* User types "Swap 100 USDC for ETH," the wallet plans the route, and the **risk + policy engine shows its work** — surfacing slippage, approval scope, and a blocked-if-malicious verdict — before the device signs and broadcasts on Sepolia. The shareable "aha" moment is the gate **catching a bad transaction the user would otherwise have signed**. It's honest (real testnet execution today), demoable in 30 seconds, and directly dramatizes the wedge.

North-star metric

Weekly Real Intents Executed (WRIE) — the count of intents that were parsed, passed the safety gate, and were **signed on-device + broadcast** each week.

It's the one number that can't be faked with vanity sign-ups: it requires a funded (testnet) wallet, a successful parse, a passed policy check, and a real broadcast — so it captures activation, product-quality, and retention in a single figure that maps straight to the core loop.

Acquisition channels — ranked for a lean, organic-first budget

RANK	CHANNEL	WHY IT FITS A SOLO, PRE-LAUNCH, LOW-BUDGET TEAM
1	Build-in-public on X/CT	Near-zero cost, compounding. Ship-log threads, "parser vs. real scam tx" demos, and honest gap-disclosure build trust with exactly our ICP. Community-led growth is the most sustainable crypto motion.
2	Founder content / demo videos	30–60s clips of the plain-English-swap + safety-gate moment are the highest-converting asset we own. Repurpose into a technical blog on the deterministic-verification doctrine for SEO + investor proof.
3	Testnet points/quest program	Crypto-native, self-selecting. Quests = execute your first real intent, trigger a risk-gate block, complete a multi-chain send. Points → future allocation tiers (non-committal, no token yet). Doubles as our activation engine.
4	Targeted communities	8–12 Discords/Telegrams around intents, chain-abstraction, AI-agents, self-custody. Show up as a builder, not a shiller — post real progress, invite feedback.
5	Referral loop (see below)	Turns activated beta users into the primary growth vector once WRIE is live.
6	Micro-partnerships	Co-demos / cross-posts with 2–3 aligned small projects (a testnet faucet, an intents infra tool, a security-education account). Barter distribution, no spend.

Deliberately excluded for now: paid ads, influencer buys, exchange listings, airdrop farming — wrong stage, wrong budget, wrong (mercenary) audience.

Activation funnel

Waitlist → Beta invite → First real intent executed → Retained.

1. **Waitlist (email + X handle):** Landing page leads with the safety-gate demo GIF. Capture handle to qualify and to power referrals.
2. **Beta invite (gated, batched):** Invite in waves to protect quality and manufacture scarcity. Onboarding hard-focuses on the single "time-to-first-intent" metric — get them to a **funded testnet wallet and their first signed intent inside one session**.
3. **First real intent executed (the activation event = +1 WRIE):** This is the definition of "activated," not sign-up. Guided first-run: pre-fund a testnet faucet, seed the input with an example intent, celebrate the on-device signature + broadcast confirmation.
4. **Retained:** Return and execute a real intent in a second week. Nudge via quest streaks, a weekly "what your gate caught" digest, and new-capability drops (added chain, Auto-mode caps).

Benchmark reality check: median pre-launch waitlist → activation runs ~11%, so we plan the funnel around **improving time-to-first-intent**, not just top-of-funnel volume.

Referral / viral loop

"Guard-a-Friend" invites. Each activated beta user gets 3 invite codes. Both parties earn quest points **only when the invitee executes their first real intent** (activation-gated, not sign-up-gated) — the same event that increments WRIE, so growth and product value are the same loop. Points ladder into early-access tiers (new chains, Auto-mode, higher caps) and a stated eligibility for any future allocation.

Referred users convert 2–3× better than cold traffic, and 15–35% of waitlisters typically share — so the referral mechanic is the single highest-ROI growth investment for a solo team. Target a realistic **k-factor of 0.15 → 0.35** over the quarter (0.15–0.25 is "good," 0.4 is "great" for consumer apps; we do not underwrite viral $k > 1$).

KPI targets — Day 30 / 60 / 90

Day 0 = start of Sprint 1. Targets sized for a solo/lean team, organic-only, testnet product.

KPI	DEFINITION	DAY 30	DAY 60	DAY 90
Waitlist	Verified email + X handle	1,200	4,000	10,000
Beta users invited (cumulative)	Given app access	100	500	1,500
Activated (cumulative)	Executed ≥ 1 real intent	40	250	800
Activation rate	Activated $\div$ invited	40%	50%	53%
WAU	Users executing ≥ 1 real intent that week	25	120	400
WRIE (north star)	Real intents executed / week	60	350	1,300
Referral k-factor	Invites $\times$ activation-conversion	0.15	0.25	0.35
Time-to-first-intent	Median, first session	< 10 min	< 6 min	< 4 min

Sprint focus: Days 1–30 = build-in-public engine + waitlist + first 100 hand-held beta activations (learn the funnel). Days 31–60 = launch quests + referral loop, push activation rate and k. Days 61–90 = scale invites against a proven funnel, harden retention, and package WRIE growth + honest roadmap into the raise narrative.

Benchmarks referenced: consumer/waitlist k-factor and share-rate norms and referred-user conversion lift ([Waitlister](#), [LotoTools K-factor guide](#), [Adapty](#)); crypto GTM waitlist/points/community-led motion ([Formo](#), [Tectonic Marketing](#)).

Social-Media Growth Plan

90-Day Social Media Growth Plan

Goal: turn a solo/pre-launch build into a credible, followed founder-led story — "the AI-native wallet, talk to your money" — and convert crypto-native attention into a waitlist + testnet-active community, *without* faking traction. Everything below assumes a lean team (Founder as primary voice; one part-time community mod from Day 31; a freelance short-form editor on a per-clip basis) and a ~\$0–2k/mo budget.

North-star for the 90 days: *distribution as a moat*. Ship in public daily, teach AI×crypto, and let the deterministic on-device safety gate become the memorable, defensible story. Grounding note from current crypto-Twitter/Farcaster reality (2026): the algorithm rewards **conversation depth over likes/RTs**, "tweet cred" is earned by steady + accurate posting and can't be bought, Farcaster is now a **niche, founder-dense** network (~40–60k DAU) best entered via a high-engagement channel rather than a campaign, and **micro-KOLs (10–100k) out-convert mega influencers ~3x with far better retention** — so the plan leans into founder POV, small trusted collaborators, and short single-idea video. (Sources at end.)

Per-Platform Strategy & Role

PLATFORM	ROLE IN THE FUNNEL	CORE JOB	VOICE
X / Twitter	Primary — top of funnel + credibility	Build-in-public flagship; threads, demo clips, founder POV, replies into crypto-Twitter conversations	Founder, first-person, technical-but-plain
Farcaster	High-signal founder/dev network	Deeper builder discourse; be <i>early and native</i> ; recruit first believers + collaborators	Founder, candid, "one of us"
Discord	Community home / retention	Testnet feedback, bug reports, "intent of the day," support; quality-of-active-users > member count	Community + Founder office hours
Telegram	Announcements + global reach	Broadcast releases; fast async support in crypto-native regions (TR, UAE, India, Brazil, ID)	Concise, ops-tone
YouTube / TikTok Shorts	Discovery + education	Sub-30s "talk to your money" demos and self-custody 101; feeds discovery→depth funnel	Screen-record + voiceover
LinkedIn	Investor / hiring / partnerships	Founder credibility, milestone posts, hiring, VC/BD reach; long-form build narrative	Professional, milestone-driven

Priority split of effort: X **50%**, Short-form video **20%**, Farcaster **15%**, Discord/Telegram **10%**, LinkedIn **5%**.

Content Pillars

Rotate these six so the feed never feels like one note. Rough weekly mix on X: **Build-in-public 30%** / **AI×crypto education 20%** / **Live demos 20%** / **Safety & self-custody 15%** / **Founder POV 10%** / **Memes 5%**.

- 1. Build-in-public** — shipping logs, "what broke today," commits, before/after UX, roadmap honesty (incl. the *gaps*: testnet-first, pre-audit). This is the trust engine.
- 2. AI×crypto education** — how intents → route → risk/policy gate → device signature works; why "AI proposes, deterministic code verifies, the signature disposes." Rides the 2025-26 agents×crypto + intents narratives.
- 3. Live product demos** — real screen-records: "*Swap 100 USDC for ETH*" typed in English, executing on Sepolia; one identity across BTC/ETH/SOL. Show the real thing (testnet-labeled) — honesty is the brand.
- 4. Safety / self-custody** — non-custodial keys on-device (scrypt + AES-256-GCM), the spend-cap gate, "how to secure a wallet," scam teardowns. Best-performing evergreen education in a scam-riddled space.
- 5. Founder POV** — why you're building it solo, hot takes on wallet UX, MetaMask/Phantom/Rabby comparisons, lessons. Depth-of-conversation fuel.
- 6. Memes** — culture-native, self-aware ("seed phrase on a sticky note" energy). Low volume, high shareability — never the whole diet.

Posting Cadence (per platform)

Grounded in 2026 data: healthy X cadence is **3–6 posts/day**; the algorithm rewards **reply depth**, so ~30 min/day of genuine replies matters more than raw volume. Short-form wins on **one clear idea in <30s**. Consistency > perfect clock-timing.

PLATFORM	CADENCE	FORMAT MIX	FOUNDER TIME/DAY
X / Twitter	3–4 posts/day + 1 thread/wk + 30 min replies	40% text takes, 25% clips/GIFs, 20% threads, 15% memes/polls	~45 min
Farcaster	1–2 casts/day; be active in a builder channel	Native casts, dev updates, Frames when a release warrants	~15 min
Discord	Daily presence; 1 founder office-hours/wk	"Intent of the day," changelog, AMA, support	~15 min (mod covers rest from D31)
Telegram	3–4 broadcasts/wk	Release notes, milestones, links to X	~5 min
YouTube / TikTok Shorts	3–4 Shorts/wk (batch-film weekly)	15–30s demos + self-custody tips	~30 min batch (editor finishes)

PLATFORM	CADENCE	FORMAT MIX	FOUNDER TIME/DAY
LinkedIn	2 posts/wk	Milestone + build-narrative + hiring/BD	~15 min

Best windows (X, 2026 data): Wed–Fri 9–11am; secondary Mon–Tue ~10am and Sun 9am–12pm (post in your audience's US/EU overlap).

90-Day Content Calendar Skeleton

Three sprints (Days 1–30 / 31–60 / 61–90). Each week has a theme + 1–2 hero posts. Everything is testnet-labeled and honest; no fabricated numbers.

Sprint 1 — Days 1–30: "Establish the voice + the wedge"

WK	THEME	HERO POST(S)
W1	Origin story	(1) Founder thread: "I'm building a non-custodial wallet you talk to in plain English. Here's why, and exactly what's real vs. not yet." (2) 30s Short: type "Send 0.01 ETH to alice" → executes on Sepolia.
W2	The safety gate	Thread + diagram: "AI proposes, deterministic code verifies, your device signs." Explain the risk/policy gate + spend caps.
W3	One identity, 3 chains	Demo clip: one seed → BTC + ETH + SOL addresses; "chain abstraction, but self-custodial."
W4	Self-custody 101	Educational Short series (3 clips): keys never leave the device; scrypt+AES; how to <i>not</i> get drained. Sprint-1 recap thread.

Sprint 2 — Days 31–60: "Depth, demos, first collaborators"

WK	THEME	HERO POST(S)
W5	Real execution week	Live-ish demo thread: the settlement-safe Uniswap v3 swap on Sepolia, end-to-end, with tx links.
W6	Intents vs. clicking	Founder POV: "Why the address-and-hex UX is the last relic of crypto. Intents replace it." Comparison clip vs. a legacy flow.
W7	Manual vs. Auto mode	Explainer: spend-caps, Auto mode that executes within limits, Manual that confirms every tx. Poll: "Would you trust an agent with a \$100 cap?"
W8	Mobile reveal	Screen-record of the Expo app (5 tabs); "same wallet, your pocket." First KOL co-post / Space.
W9	AMA + feedback	Discord office hours + X Space: "roast my wallet." Publish what you're fixing (radical transparency).

Sprint 3 — Days 61–90: "Waitlist momentum + narrative"

WK	THEME	HERO POST(S)
W10	Agents×crypto thesis	Long thread + LinkedIn essay: " <i>The AI-native wallet is the interface for the agent economy.</i> " Ride the intents/chain-abstraction narrative.
W11	Guarded mainnet	Honest demo: real mainnet ETH send with the explicit real-funds confirm + \$1k cap. "Guardrails first."
W12	Community showcase	Repost best community intents/bugs found; "built with you." Farcaster Frame for waitlist.
W13	90-day build recap + waitlist push	Recap thread (what shipped, honest gaps, what's next: audit + mainnet coverage) + coordinated micro-KOL waitlist drive.

Always-on layer (every week): 1 build-in-public log/day on X, 1 self-custody tip, 1 meme, 30 min of real replies, weekly Shorts batch, weekly LinkedIn milestone.

Creator / KOL & Collaboration Approach

Skip mega-influencers and paid shills — they hurt "tweet cred" and retain badly (KOC-acquired users retained ~22% at 30 days vs. ~6% from big KOLs). Play the micro/credibility game:

- **Target profile:** 10–100k-follower crypto-native **builders, wallet/DeFi/security educators, and AI×crypto commentators** with 5–20% engagement. Prioritize *technical credibility* over reach.
- **Sprint 1 (D1–30):** identify a **list of 30** micro-KOLs + 10 Farcaster builders. Engage genuinely (thoughtful replies, quote-posts) — *earn* the relationship before any ask. No payments yet.
- **Sprint 2 (D31–60):** convert 5–8 warm ones into **collabs**: joint X Spaces, "review the safety gate" demos, guest AMAs in Discord. Offer *early access + a real POV*, not cash. Target 1 security-focused voice to vet the self-custody claims publicly.
- **Sprint 3 (D61–90):** run a small **waitlist push** with 3–5 aligned micro-KOLs, structured on measurable KPIs (waitlist signups, testnet activations) rather than flat fees. Seed a Farcaster Frame in a high-engagement builder channel.
- **Founder-to-founder & ecosystem:** engage wallet-adjacent and L2/AI-agent projects for **mutual amplification**; apply to relevant demo days / builder showcases. LinkedIn for VC/BD warm intros off the milestone posts.
- **Guardrails:** every collaborator must know and repeat the honest state (testnet-first, pre-audit). One disprovable hype claim from a partner can cost more credibility than the collab earns.

Follower / Community Growth Targets

Realistic for a **solo founder starting near zero**, prioritizing *engaged* over vanity. A community with 500 real daily talkers beats one with 50k lurkers — track active users, reply depth, and testnet activations, not just follower count.

METRIC	DAY 30	DAY 60	DAY 90
X followers	750	2,500	6,000
X avg. engagement rate	≥4%	≥5%	≥6%
Farcaster followers	200	600	1,500
Discord members (active)	150 (40 active)	500 (120 active)	1,200 (300 active)
Telegram members	200	600	1,500
Shorts (best-clip views)	1 clip >5k	1 clip >25k	1 clip >75k
LinkedIn followers	300	700	1,500
Waitlist signups	250	1,000	3,000
Testnet-activated wallets	40	200	600
Collabs / Spaces done	1	4	8

Leading indicators to watch weekly: reply-chain depth on X (author-engaged conversations), Discord DAU/active-speakers, waitlist→testnet conversion %, and Short retention (>50% at 3s). If follower count climbs but *active* users and waitlist stall, the content is entertaining but not converting — rebalance toward demos + self-custody proof.

Product Visibility & Launch

What "launch" means here (honest scope). Day 0 is not a token, not an audited custody GA. It is the **public beta** of the AI-native non-custodial wallet — plain-English intents, on-device signing, live on Sepolia / Solana devnet / BTC testnet, with the guarded mainnet ETH opt-in (\$1k cap). Every asset below markets *exactly that*: "talk to your money," self-custody, deterministic safety gate. No implied audit, no implied mainnet-everything, no token farming. The launch beat we buy attention with is the **Product Hunt + Crypto-Twitter moment**; the durable asset we build is the **waitlist → private-beta → advocate** funnel. **Owners.** **F** = Founder (you). **CM** = fractional community/DevRel contractor (~\$2.5–4k/mo, part-time from Day 15). **D** = design/motion contractor (project-based). Solo-lean by design.

Sprint map at a glance

SPRINT	DAYS	THEME	EXIT MILESTONE
Sprint 1 — Seed	1–30	Stand up the funnel; recruit private beta; warm the KOLs	Waitlist $\geq$ 1,500 ; 50 private-beta cohort live; 8 KOLs briefed
Sprint 2 — Build in public	31–60	Weekly demos, PR groundwork, partnerships in motion	Waitlist $\geq$ 3,500 ; beta $\geq$ 400 ; $\geq$ 1 ecosystem LOI; PH assets locked
Sprint 3 — Launch	61–90	T-minus sequence → public beta launch → post-launch loop	Waitlist $\geq$ 5,000 ; PH top-3 of the day ; $\geq$ 1,500 activated wallets; NPS baseline

Primary metric is not signups, it's **activation**: waitlist → wallet created → first intent executed on testnet. Target $\geq$ 35% waitlist→activation by Day 90.

1. Waitlist + private-beta program mechanics

Waitlist (Day 1 live). One-screen page, single promise ("Your wallet, in plain English"), 20-second product video, live demo GIF of an intent parsing → risk gate → signature. Capture email + optional wallet address (SIWE) + a one-tap "which chain do you live on" segmenter.

- **Referral loop.** Each signup gets a code; positions move up per referral. Rewards are *thesis-aligned, not points-farming*: earlier beta access, a **"Genesis" cosmetic wallet badge**, and a private Discord role. Current crypto playbooks are explicit that early tasks should *mirror the product's promise* rather than random social quests — so our only "task" is **execute one testnet intent**, which doubles as activation. Target viral coefficient **k $\geq$ 0.4**.
- **Anti-Sybil from Day 1.** SIWE + email + light proof-of-humanity; we are custody-of-keys software, so a clean, non-farmed list matters more than a vanity number. (Owner: **F**.)

Private beta — three gated cohorts (invite from the waitlist, weighted to referrers and to devs/crypto-natives who'll give real feedback):

COHORT	TIMING	SIZE	PURPOSE
Alpha	Day 10–30	50	Break the intent parser; harden encrypted backup/restore; kill top edge-cases
Beta-1	Day 31–55	~150	Testnet execution at volume; guarded-mainnet ETH dogfood; NPS baseline
Beta-2	Day 56–75	~400	Scale + referral engine on; source launch-day testimonials & clips

Each cohort ships with a **Loom walkthrough**, a **Telegram/Discord back-channel**, and a **weekly Typeform pulse**. Instrument the funnel end-to-end (create → unlock → parse → execute) so we launch on *evidence*, not vibes. (Owner: [F](#) + [CM](#).)

2. KOL / influencer seeding

The 2025–26 consensus: **micro-KOLs (10k–50k followers) with niche fit out-convert megaphones** — trust and topic-match beat raw reach, and CT audiences punish paid-shill energy. So we seed *relationships*, not sponsorships.

- **Build the list (Day 5–15).** 25–30 targets across three narratives we ride — **self-custody UX** (wallet/security voices), **AI-agents × crypto**, **intents / chain abstraction**. Tier them:

TIER	PROFILE	ASK	COUNT
A — Anchors	50k–200k, wallet/security/AI-agent thought leaders	Early private-beta seat + a real reaction; co-host one Space	3–5
B — Core	10k–50k, high-fit builders/educators	Beta access + honest quote-tweet if they like it	12–15
C — Grassroots	<10k, devs & power users from beta	Organic clips, "I tried it" threads	10+

- **Seed the product, not a script.** Give A/B tier a personal Loom + a no-strings beta seat 2–3 weeks pre-launch. The deliverable is an *authentic* "watch me swap by typing a sentence" clip. Budget a small honorarium pool (~\$3–6k total) only for A-tier time, disclosed. (Owner: [F](#) for relationships, [CM](#) for logistics.)
- **The demo is the hook.** Nothing converts a wallet KOL like watching **"Swap 100 USDC for ETH"** parse, get risk-gated, and sign on-device with keys that never leave the machine. Lead every outreach with a 15-sec clip.

3. Crypto PR + media

Product Hunt (the launch-day centerpiece). Grounded in current #1-of-the-day playbooks:

- **Prep ≥ 6 weeks out.** PH is won in the **first hour** and largely by the audience you *already* have — it is an amplifier, not a discovery engine. Build the supporter list now.
- **Ship (T-0):** launch **Tue/Wed/Thu at 12:01am PT** for the full 24-hour window; a hunter is optional in 2025 — self-launch is fine. Assets: gallery images, a <60s demo video, a crisp first comment (the

"why we built this" founder note), and a **maker actively replying to every comment** (top products average an ~8-min response time — block the whole day).

- **Realistic target: top-3 Product of the Day**, ~700–1,000 *quality-weighted* upvotes from real, aged accounts in our network. **Never** solicit fresh/burner votes — PH clears them and it's reputationally toxic for a wallet.

Crypto newsletters & media (T-14 → T+7 windows). Pitch angle: *"the AI-native, non-custodial wallet — deterministic safety gate, one identity across BTC/ETH/SOL."*

- **Newsletters:** *Milk Road, Bankless, Week in Ethereum News, The Defiant, Blockworks Daily.*
Personalized pitch + a 90-sec demo; offer an exclusive first-look to one outlet to earn a real write-up.
- **Podcasts / Spaces:** target 2–3 founder pods (self-custody / AI-agents / wallet-UX shows) recorded in Sprint 2 to *drop during* launch week.
- **Owned PR:** a launch blog post + a **founder launch thread** (build-in-public story, the "AI proposes, code verifies, device signs" doctrine, honest gaps). (Owner: **F** writes, **D** on assets.)

Twitter/X — build in public (continuous). 4–5 posts/week: weekly demo clips, edge-cases we fixed, security choices (scrypt + AES-256-GCM, keys never leave device). Live founder Spaces convert on *transparency* — lean into it.

4. Ecosystem partnerships

Pick **infra we already touch** so integrations are real, not press-release theater. Sequence: outreach in Sprint 1, integrate/announce across Sprint 2–3.

PARTNER TYPE	CONCRETE TARGETS	THE ASK / VALUE EXCHANGE
Wallet connectivity	WalletConnect / Reown	Listing + co-marketing once dApp-connect flow is solid
RPC / node infra	Alchemy, Infura, QuickNode	Startup credits + logo/quote; a "built on" co-post
An L2	Base, Arbitrum, or Optimism ecosystem/grants	Ecosystem tweet, grant, "intents on \<L2>" angle
Solana	Solana Foundation / Helius	Devnet→mainnet path story, co-content
Data/risk	a price/risk API we cite in the safety gate	Credibility for the deterministic gate

Deliverable by Day 90: **≥1 signed integration or LOI + ≥1 ecosystem co-marketing post** timed to launch. Grants also extend the lean runway. (Owner: **F**.)

5. Community events + AMAs

- **Home base:** a lean **Discord/Telegram** (Day 8) with beta, dev, and feedback channels — quality over headcount; this is a security product, not a memecoin.
- **Cadence: weekly "Intent Fridays"** live demo (15 min, ship one new intent), and a **bi-weekly founder AMA/Space** — live, unscripted, transparent, which is precisely what earns CT trust.

- **Launch-week co-hosted Spaces** with 2–3 A-tier KOLs and one ecosystem partner (T-2 and T+3).
 - **Ambassador micro-program (Day 45):** 8–10 grassroots power-users from beta get early features + a role, seeding organic launch-day clips. (Owner: **CM**, **F** hosts.)
-

6. T-minus launch sequence (checklist)

T-14 → T-7 — Load the cannon - [] Product Hunt page drafted (gallery, <60s video, first comment) — private preview link circulated - [] Supporter list finalized: **150+ committed real accounts** DM'd with launch date/time - [] KOL A/B tier have beta access + their clips in hand - [] Newsletter/podcast pitches sent; ≥1 exclusive first-look confirmed - [] Launch blog + founder thread written and scheduled - [] Guarded-mainnet ETH path + testnet flows regression-tested; status page ready - [] Support rota + FAQ + known-issues doc ready (honest about gaps)

T-3 → T-1 — Prime - [] "Launching Tuesday" teaser thread + Space announced - [] Waitlist blast #1 ("we go live in 72h — you're on the early list") - [] Discord/TG pinned launch-day plan; ambassadors briefed on timing - [] Assets loaded into scheduler (X, LinkedIn, Reddit r/ethereum-r/CryptoCurrency where allowed)

T-0 — Launch day (Tue/Wed/Thu) - [] **12:01am PT:** Product Hunt goes live - [] Founder first comment posted immediately; **reply to every comment (<10 min) all day** - [] Fire the sequence: founder thread → waitlist email #2 → Discord/TG @here → KOL clips staggered through the day (not all at once) - [] Newsletter/press pieces drop; podcast episodes release - [] **Live launch Space** (afternoon PT) with KOL + partner - [] Real-time dashboard watch: PH rank, signups, **activations**, error rates — hotfix on standby

T+1 → T+14 — Convert & compound - [] "We launched — here's what happened" recap thread with real numbers (honest, no vanity) - [] Thank + spotlight every KOL/partner/ambassador who showed up - [] Waitlist email #3: onboarding nudge → drive **create-wallet** → **first-intent activation** - [] Ship the **top-3 launch-feedback fixes fast** and announce them (proof we listen) - [] Second-wave outlets/podcasts that missed day-one; submit to wallet directories & "AI x crypto" roundups - [] Investor update: launch metrics + activation curve

7. Post-launch loop (the durable engine)

A weekly flywheel that outlives the launch spike:

Ship → Demo → Clip → Seed → Feedback → Ship.

1. **Ship** one visible improvement/intent weekly.
2. **Demo** it on Intent Friday.
3. **Clip** the best 20 seconds; founder + ambassadors distribute.
4. **Seed** clips to relevant KOLs (relationship, not payment).
5. **Feedback** via in-app + pulse survey → back into the backlog.
6. **Monthly:** public changelog, NPS re-measure, and a metrics-honest investor + community update.

Retention beats reach: every loop optimizes **week-4 retention and activation**, not raw signups — that's the number that proves the "talk to your money" wedge is real ahead of the audit + mainnet-GA push.

Budget & KPI summary (lean, solo-founder)

LINE	90-DAY SPEND
Fractional community/DevRel (CM , ~2.5mo)	\$6–10k
Design/motion (D , launch assets + clips)	\$2–4k
KOL A-tier honoraria (disclosed)	\$3–6k
Tools (email, waitlist, analytics, scheduler)	\$0.5–1k
Total	~\$12–21k (much offset by infra/ecosystem credits)

KPI	DAY-90 TARGET
Waitlist (clean, non-farmed)	≥ 5,000
Activated wallets (created + ≥1 testnet intent)	≥ 1,500
Waitlist → activation rate	≥ 35%
Product Hunt	Top-3 of the day, 700–1,000 quality upvotes
Ecosystem deals	≥ 1 signed/LOI + ≥ 1 co-marketing post
Earned media	≥ 2 newsletter mentions + ≥ 2 podcasts
Week-4 retention (beta)	Baseline set, ≥ 25%
